About the Software

Built for organisations that have to defend their numbers

Carbon Ledger is a cloud-based greenhouse gas accounting platform for companies that report emissions to regulators, investors, customers or the public. It covers the full inventory: **Scope 1** direct emissions, **Scope 2** purchased energy — dual-reported location-based and market-based — and all fifteen **Scope 3** value-chain categories defined by the GHG Protocol.

Most carbon tools stop at a number. Carbon Ledger is built around the harder requirement: **showing your work**. Every record stores the activity data, the exact emission factor version applied, the gas-by-gas breakdown, the GWP set used, the data-quality tier, and a complete audit trail of who entered and who approved it. When an assurer, a regulator or your own board asks where a figure came from, the answer is one click away.

Who it's for

Sustainability & ESG teams

Own the inventory end to end without living in twenty spreadsheets that no two people can reconcile.

Facility & operations managers

Enter fuel, electricity and refrigerant data through guided flows that need no carbon-accounting expertise.

Finance & disclosure officers

Produce CSRD, CDP and GRI figures from one inventory, so filings to different bodies cannot contradict each other.

Regulated facilities in Abu Dhabi

Generate a filled EAD MRV workbook from data already in the system — no parallel process.

Auditors & verifiers

Trace any reported tonne to its source document, factor version and approver through an immutable audit log.

Suppliers in your value chain

Respond to Scope 3 data requests through a secure portal — no account, no password, one link.

The problem it solves

Corporate carbon inventories are still assembled by hand: fuel logs emailed as PDFs, utility bills retyped, factors copied from a decade-old spreadsheet, Scope 3 estimated once and never revisited. The result is **an inventory nobody can reproduce**. When the factor library updates, prior years silently shift. When a supplier restates, nothing downstream recalculates. When an assurer asks for evidence, someone spends three weeks reconstructing it.

Carbon Ledger replaces that with a single system of record where the calculation is explicit, factors are versioned and locked to each record, and evidence is attached at the point of entry.

15

Scope 3 categories, individually tracked and reported

3

Disclosure frameworks from one consistent inventory

2

Scope 2 methods reported in parallel, never merged

10

Workflow stages, from raw activity data to filed report

Why Choose Carbon Ledger

Advantages that show up in your assurance letter, not just your dashboard

DEFENSIBILITY

Factors are versioned and locked

Each record pins the exact factor version, dataset and validity window used at the moment of calculation. Updating the library never silently rewrites last year's inventory.

`dataset_version · valid_to`

CORRECTNESS

Scope 2 reported both ways, always

Location-based and market-based totals travel side by side through every report, with renewable certificates tracked as first-class records — not netted off in a footnote.

`ESRS E1-6 §44(b) · CDP C6.3 · GRI 305-2`

COVERAGE

Scope 3 that is actually populated

Four routes into the hardest scope: guided category entry, spend-based EIO factors, supplier surveys that auto-convert to records, and bulk import — instead of one estimate a year.

`15 GHG Protocol categories`

DATA QUALITY

Quality is measured, not assumed

Every record is classified primary, secondary or estimated, producing a 0–100 quality score by company, scope and supplier — so you know which numbers to improve first.

`per-supplier scorecard`

REGULATORY

Regulator-grade MRV, no second system

An opt-in MRV layer decomposes the same Scope 1 records into the EU-ETS formula and reconciles the two — then fills the official EAD workbook cell by cell.

`Activity × NCV × EF × Oxidation × Conversion`

GOVERNANCE

Multi-company by architecture

Group structures, subsidiaries and separately reporting entities are isolated at the database query level, with a company switcher for users who legitimately span several.

`global tenant scope · deny-by-default`

**Before: an inventory you assembled.
After: an inventory you can reproduce.**

THE DIFFERENCE AN ASSURER NOTICES

Key Features

Every capability described here is working software, not roadmap

SCOPE 1

Guided Scope 1 entry

A three-step flow — Source, Data, Review — across stationary, mobile and fugitive sub-categories, covering natural gas, diesel, LPG, coal grades, biofuels, jet fuel, refrigerants, SF₆ and PFCs. CO₂e previews live as you type.

SCOPE 2

Purchased energy, dual-reported

Thirteen supply arrangements — grid electricity, green tariffs, PPAs and VPPAs, landlord-supplied, on-site third-party renewables, CHP, EV charging — each carrying both a location-based and market-based result.

SCOPE 3

All fifteen categories

Upstream categories 1–8 and downstream 9–15, each described in plain language at the point of entry, with spend-based input-output factors where activity data does not exist.

CLASSIFICATION

Scope Finder

Describe an activity in your own words and Scope Finder returns the right scope and category, with a deterministic keyword fallback so it never leaves you without an answer.

DOCUMENT CAPTURE

Utility bill reading

Upload an electricity or fuel bill as PDF or image. Consumption, date, cost and supplier are extracted through a cascading OCR chain with AI-assisted structured reading, sanity-checked before reaching your inventory.

VALUE CHAIN

Supplier surveys, no login

Send a one-time secure link. Suppliers answer, save partially and return later without an account. Tagged answers convert automatically into draft Scope 3 records against the right category.

ASSURANCE

Review queue & validation

Records arrive as drafts. A filterable queue flags missing facility or department, shows the data source — import, manual or API — and supports bulk validate, reject or delete.

ASSURANCE

Data quality scoring

Primary, secondary and estimated classification produces a rolling quality score with a twelve-month trend and per-supplier scorecard, so engagement effort goes where it moves the number.

DISCLOSURE

Three frameworks, one inventory

CSRD/ESRS E1, CDP Climate Change and GRI 305 datapoints emit from a single computed inventory — so filings are internally consistent by construction, not by cross-checking.

REGULATORY

EAD / EU-ETS MRV layer

Opt in per facility and per year. Source streams, emission sources, measuring instruments and tiered uncertainty feed a filled EAD submission workbook — while ordinary users never see a tier or an NCV.

ANALYSIS

Hotspot & Pareto analysis

Rank emissions by source, facility, department or supplier with running cumulative percentages, so the few contributors driving most of your footprint surface immediately.

TRACEABILITY

Audit trail on every change

Emission records, factors, targets and all MRV entities write to an immutable audit log — who changed what, when, and from which value to which.

Modules

The navigation your team actually sees, and what each part does

MODULE	WHAT IT DOES
Dashboard	Total, Scope 1, Scope 2 and Scope 3 emissions with month-over-month change, a monthly trend against a reduction pathway, and your top ten sources.
Analytics	Breakdown with drill-down, intensity metrics, year-over-year, waterfall, hotspots and treemap — all sharing one filter set.
Manual Entry	Direct record creation for users who know exactly what they are entering.
Scope 1 Entry	Guided stationary, mobile and fugitive combustion entry with a live CO ₂ e preview.
Scope 2 Entry	Purchased electricity, heat, steam and cooling with location- and market-based treatment.
Scope 3 Entry	Category-led entry across all fifteen upstream and downstream categories.
Scope Finder	Free-text activity classification into the correct scope and category.
Import Data	Bulk CSV and Excel import with validation before anything is committed.
Review Data	The validation queue: pending versus validated, issue flags, and bulk actions.
Upload Bills	Utility bill OCR and extraction into reviewable draft records.
Import History	A full record of every import with retry, cancel and per-batch audit.
Data Source	Provenance view across manual, imported, OCR and API-originated data.

MODULE	WHAT IT DOES
Reports	Executive Summary, Regulatory Compliance, Internal Analysis and Public Disclosure reports, with scheduling.
GHG Protocol Report	The formal inventory: Scope 1 split by stationary, mobile, fugitive and process; Scope 2 dual-reported; Scope 3 by category.
Disclosure Reports	CSRD/ESRS E1, CDP and GRI 305 datapoint packs from one inventory.
MRV (EAD / EU-ETS)	Facility-level regulatory submission: source streams, instruments, tiers and the filled EAD workbook.
Targets & Goals	Science-based, net-zero, carbon-neutral, regulatory and internal targets tracked against a pathway.
Suppliers	Supplier master data with emissions and data-quality scores attached.
Supplier Surveys	Build, send, remind and track surveys that auto-convert into Scope 3 records.
Data Quality	Primary/secondary/estimated scoring by company, scope, month and supplier.
Settings	Facilities, departments, emission sources, factors, energy certificates, countries, companies, users, roles and the audit trail.

The Dashboard Experience

The state of your inventory, in one screen

The dashboard opens on four headline figures — total emissions and the Scope 1, 2 and 3 split — each carrying its month-over-month change. Below, a monthly trend line plots actual emissions against a reduction pathway, and your ten largest sources are ranked by contribution.

Every widget answers to one shared filter bar: **date range** (last twelve months, year to date, last three months or a custom window), **facility**, **department** and **category**. Change a filter and the whole page follows.

HEADLINE

Total & per-scope emissions

Four figures with month-over-month movement, so a spike is visible the day it appears rather than at year end.

TREND

Actual against pathway

Monthly actuals plotted against a reduction reference line — are you tracking, or telling yourself you are?

RANKING

Top ten sources

Your largest contributors by CO₂e — the fastest route from "our footprint is large" to "this is what to do about it".

ACTIVITY

Recent records

A paginated, filter-aware feed of what has just been entered — and by whom.

FIRST RUN

Guided onboarding

New companies are walked through a setup wizard rather than dropped onto an empty dashboard with nothing to interpret.

CONTEXT

Company switcher

Users with legitimate access to several entities move between them from the sidebar, with data isolation enforced underneath.

End-to-End Workflow

Ten stages, from a fuel receipt to a filed disclosure

01

Set the boundary

Onboarding establishes company, facilities, departments and the consolidation approach — operational control by default.

02

Capture activity data

Guided entry, bulk import, utility bill OCR or supplier survey — four routes into the same record structure.

03

Classify the scope

Scope Finder resolves ambiguous activities into the right scope and category before they enter the inventory.

04

Apply and lock the factor

The matching factor version is applied and pinned to the record with its gas breakdown and GWP set.

05

Attach the evidence

Source documents — bills, meter readings, invoices — are uploaded against the record at the point of entry.

06

Review and validate

Records sit as drafts in a queue until a reviewer validates them, individually or in bulk.

07

Score data quality

Each record is classified primary, secondary or estimated, rolling up to company, scope and supplier scores.

08

Analyse and target

Hotspots, intensity and year-over-year identify where to act; targets record what you have committed to.

09

Report and disclose

GHG Protocol inventory, executive reporting, and CSRD, CDP and GRI datapoints from one consistent base.

10

File and defend

EAD MRV workbook export where required, with the audit trail standing behind every figure submitted.

How teams experience it

A facility manager photographs an electricity bill and uploads it; consumption, date and cost are read out and staged as a draft. An analyst reviews the queue, confirms the facility, and validates — the factor version is already locked to the record. Meanwhile a procurement lead sends survey links to forty suppliers, who respond without ever creating an account, their answers landing as draft Scope 3 records against the right categories.

At quarter end, the analyst opens Analytics, sees that three sources account for most of the movement, and drills in. At year end, the disclosure officer generates ESRS E1, CDP and GRI packs from the same inventory — and, for the regulated facility, exports the EAD workbook. **Nothing was re-keyed. Nothing has to be reconciled.**

Reports & Analytics

Six analytical views, four report types, three disclosure frameworks

Breakdown with drill-down

Split by scope, source, facility, department, site or month — then click a scope to see its sources, and a source to see its records.

Intensity metrics

Emissions per employee and per million of revenue, correctly prorated to the selected period, with a monthly trend and per-scope split.

Year-over-year

The current period against the preceding equal-length window — monthly, quarterly or annual — with absolute delta, percentage and direction.

Waterfall

Which sources drove the change between periods, ranked by absolute movement, so an aggregate shift becomes an explanation.

Hotspots

Pareto ranking by source, facility, department or supplier with running cumulative percentage.

Treemap

The whole inventory as one proportional picture: scope to source, colour-coded by scope.

Disclosure datapoints

FRAMEWORK	REFERENCE	COVERAGE
CSRD / ESRS E1	E1–6 §44(a)–(d), §48	Gross Scope 1; Scope 2 location- and market-based; Scope 3; totals on both Scope 2 bases; biogenic CO ₂ separately; GWP basis; consolidation approach.

FRAMEWORK	REFERENCE	COVERAGE
CDP Climate Change	C5.1, C6.1–C6.10	Scope 1; Scope 2 on both bases; Scope 3 total; biogenic CO ₂ ; CO ₂ , CH ₄ and N ₂ O shares of total; global warming potentials used.
GRI 305	305-1, 305-2, 305-3	Direct, energy indirect on both bases, and other indirect emissions, with biogenic CO ₂ , GWP source basis and consolidation approach.
GHG Protocol	Corporate Standard	Scope 1 by stationary, mobile, fugitive and process; Scope 2 dual-reported; Scope 3 across all fifteen categories.
EAD / EU-ETS MRV	Tier 1-4	Facility source streams and emission sources, measuring instruments, tiered uncertainty and materiality, exported into the official EAD workbook.

Reporting & distribution

Four audiences, four report types

Executive Summary, Regulatory Compliance, Internal Analysis and Public Disclosure — each built from templates you can adapt.

PDF, Excel and CSV

Queued export jobs run in the background and land as downloadable files, with tenant isolation enforced on every download.

Scheduled distribution

Daily, weekly, monthly, quarterly or yearly generation, emailed to a recipient list — with a run-now action for the meeting you forgot about.

Product Gallery

Screenshot slots — drop your captures in, the captions are written

SLOT 01 · DASHBOARD
1600 × 900

The Emissions Dashboard

Total, Scope 1, Scope 2 and Scope 3 emissions with month-over-month movement, the monthly trend against a reduction pathway, and the top ten sources.

✓ **The state of the inventory in one screen, for every role.**

SLOT 02 · ANALYTICS & HOTSPOTS

1600 × 900

Analytics & Hotspot Analysis

Breakdown with drill-down, Pareto hotspots by source, facility, department or supplier, and the full inventory as a scope-coloured treemap.

✓ **Reduction effort aimed at the few contributors that move the number.**

SLOT 03 · SCOPE 1 GUIDED ENTRY

1600 × 900

Guided Emission Entry

Source, Data, Review. The applied emission factor is shown as it is selected, and CO₂e is calculated live as the quantity is typed.

✓ **Facility staff enter data correctly without carbon-accounting training.**

SLOT 04 · BILL UPLOAD & EXTRACTION

1600 × 900

Utility Bill Reading

A PDF or photographed bill is read, and consumption, date, cost and supplier are extracted and staged for review with a confidence rating.

✓ **Hours of retyping replaced by a review that takes seconds.**

SLOT 05 · SUPPLIER PORTAL

1600 × 900

Supplier Portal

A one-time secure link opens the survey with no account required. Suppliers can save partially and return; tagged answers become draft Scope 3 records.

✓ **The response rates that make Scope 3 credible.**

SLOT 06 · ESRS E1 DISCLOSURE PACK

1600 × 900

Disclosure Reports

CSRD/ESRS E1, CDP and GRI 305 datapoints generated from one computed inventory, each labelled with its framework reference.

✓ Filings that cannot contradict each other.

SLOT 07 · MRV SOURCE STREAMS

1600 × 900

EAD / EU-ETS MRV Workspace

Per-facility source streams, emission sources, measuring instruments and tiers — pre-populated from existing Scope 1 records, exported as the official EAD workbook.

✓ A regulatory submission produced from data you already hold.

SLOT 08 · DATA QUALITY & REVIEW

1600 × 900

Data Quality & Review

Primary, secondary and estimated classification with a twelve-month trend and per-supplier scorecard, alongside the validation queue and its issue flags.

✓ **You know which figures are solid before the assurer tells you.**

Business Benefits

What changes for your organisation

An inventory you can reproduce

Versioned factors, locked calculations and a complete audit trail mean the same inputs always give the same answer — the precondition for external assurance.

Assurance costs less

Evidence is attached at the point of entry and traceable from any reported figure, so verification becomes sampling rather than reconstruction.

Scope 3 stops being a guess

Supplier surveys, spend-based factors and category-level entry replace a single annual estimate with data that improves every cycle.

Filings stop contradicting each other

CSRD, CDP and GRI figures derive from one inventory, so the number in your annual report matches the one in your CDP response.

Data entry stops being specialist work

Guided flows, bill reading and scope classification let facility staff contribute accurate data without becoming carbon accountants.

Reduction effort finds its target

Hotspot and waterfall analysis point at the specific sources driving your footprint and its movement, instead of a total nobody can act on.

Regulatory readiness, no second system

The MRV layer reads the records you already maintain — no parallel process, no reconciliation between your inventory and your submission.

Group reporting without spreadsheets

Subsidiaries maintain their own inventories under strict isolation while the group consolidates, with cross-entity access an explicit permission.

Technical Highlights

Architecture built around traceability and tenant isolation

ISOLATION

Tenant scoping, deny by default

Company isolation is enforced by a global query scope on every core model. A user without a resolved company context returns nothing — the fallback is refusal, never an unscoped query.

ACCESS

Granular role-based permissions

Every action is permission-gated, with roles from Super Admin to standard User, a full roles and permissions interface, and per-user navigation restrictions.

TRACEABILITY

Immutable audit trail

Emission records, factors, targets and all MRV entities write every change to an audit log surfaced inside the application.

INTEGRITY

Factor versioning & locking

Factors carry dataset version, validity window, issuing organisation and country. Records pin the version used, so historical inventories stay stable.

CORRECTNESS

Dimensional unit conversion

A dedicated conversion service normalises units and rejects incompatible ones, rather than trusting that whoever typed "gal" meant what you did.

RECONCILIATION

MRV decomposition that agrees

The EU-ETS decomposition is asserted to reconcile with the combined-factor result, so regulatory and management views of a facility cannot silently diverge.

INTERFACE

Server-rendered and responsive

A fast, conventional web interface with server-side tables that stay responsive at inventory scale, usable on a phone in a plant room.

ASSISTED

AI where it earns its place

Bill extraction and scope classification use AI with deterministic fallbacks, sanity ceilings and recorded confidence. AI proposes, the audit trail records, a human approves.

Standards & methodologies implemented

- GHG Protocol Corporate Standard
- Scope 3 — 15 categories
- Scope 2 Guidance — dual reporting
- CSRD / ESRS E1
- CDP Climate Change
- GRI 305
- EU-ETS / EU-MRV Tiers 1–4
- EAD Abu Dhabi MRV
- ISO 14064
- SBTi target types
- GLEC
- PCAF
- IPCC · DEFRA · EPA factor sources

Industries Served

Wherever emissions have to be measured, defended and disclosed

SCOPE 1 INTENSIVE

Energy, oil & gas, utilities

Stationary combustion at scale, fugitive methane, flaring and process emissions — the operations where the MRV layer and tiered uncertainty matter most.

SCOPE 1 INTENSIVE

Manufacturing & heavy industry

Multi-facility fuel and process inventories with facility-level reporting, department attribution and per-site intensity.

SCOPE 2 INTENSIVE

Real estate & facilities

Portfolios of buildings with landlord-supplied and shared electricity, green tariffs and on-site renewables — where market-based reporting is the whole question.

SCOPE 3 INTENSIVE

Retail, FMCG & supply chain

Footprints dominated by purchased goods and transport, where supplier surveys and spend-based factors do the heavy lifting.

SCOPE 3 INTENSIVE

Financial services

Modest operational emissions and a decisive category 15, with per-supplier and per-counterparty data quality made explicit.

ADVISORY

Consultancies & assurance providers

Multiple client inventories under strict tenant isolation, with a company switcher for staff who legitimately work across several.

**Built in the UAE, for reporters facing both
international disclosure and local regulatory MRV.**

EAD ABU DHABI • CSRD • CDP • GRI

Why Our Solution

Against spreadsheets, and against the international platforms

Regulatory MRV the majors don't ship

The large international carbon platforms cover disclosure well and local regulatory submission barely at all. Carbon Ledger produces a filled EAD Abu Dhabi workbook natively, from data you already hold.

Traceability as architecture

Factor locking, audit trails and evidence attachment are how records are stored — not a compliance module bolted on later that covers only some of the data.

One inventory, every framework

Point tools produce a CDP response and a separate ESRS figure that disagree. Here the frameworks are views onto one computed inventory, so consistency is structural.

Scope 3 with a route to real data

Most platforms let you estimate Scope 3. This one gives you a supplier portal, auto-conversion and a per-supplier quality score — a mechanism for the estimate to get better.

Entry designed for non-specialists

Guided flows, live CO₂e preview, bill reading and scope classification mean the people closest to the data can enter it — the only way an inventory stays current.

Regional presence, direct support

Built and supported from Dubai, in the regulatory context and time zone of the reporters using it — not a support queue eight hours behind you.

Measure it once. Defend it anywhere.

EVERY CLAIM HERE CORRESPONDS TO SHIPPED FUNCTIONALITY

Contact Us

See Carbon Ledger against your own inventory

Bring one facility's fuel and electricity data to the demo and we will build that part of your inventory live — including what your CSRD, CDP and GRI figures would be.
